var createCompounder = require('./internal/createCompounder');  
/\*\* \* Converts `string` to [snake case](https://en.cppreference.com/w/cpp/string/basic/snake\_case). \* @static \* @memberOf \_ \* @category String \* @param {string} [string=''] The string to convert. \* @returns {string} Returns the snake cased string. \* @example \* \_snakeCase('Foo Bar'); // => 'foo\_bar' \* \_snakeCase('fooBar'); // => 'foo\_bar' \* \_snakeCase('--foo-bar'); // => 'foo\_bar' \*/ var snakeCase = createCompounder(function(result, word, index) { return result + (index ? '-' : '') + word.toLowerCase(); });  
module.exports = snakeCase;  
Q: Open a UIViewController from a UITableViewCell I have an app which, when the user taps on a UITableViewCell, opens the view controller of that UITableViewCell to confirm whether or not to delete the data. Problem is I have another UITableViewCell which will display a list of users, and I need to be able to do the same thing there. How can I do this? The idea is that when a user taps on that cell, the same controller opens, not a new instance of the controller. EDIT Here's what I have so far. - (void)tableView:(UITableView \*)tableView didSelectRowAtIndexPath:(NSIndexPath \*)indexPath { UIStoryboard \*storyboard = [UIStoryboard storyboardWithName:@"Main" bundle:nil]; ChatViewController \*chatController = [storyboard instantiateViewControllerWithIdentifier:@"ChatViewController"]; [self presentViewController:chatController animated:YES completion:nil]; } Now I have the problem that, when I tap on the user cell, the ChatViewController is opened in the middle of the app. I just want it to be opened when I tap on the cell. 1 82157476af
